Cover and administrative overview

CLIMACITIES

Climate Intelligence for Equitable and Adaptive European Cities

A fully fictional document for information-extraction evaluation.

Synthetic topic identifier: HORIZON-MISS-2027-CLIMA-SYN-01

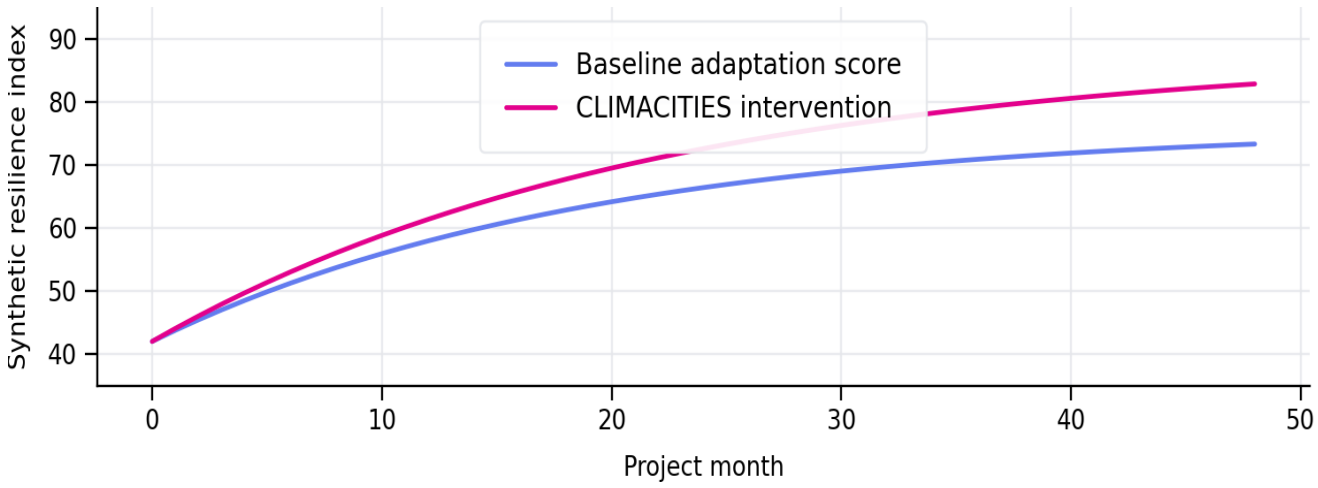

Action type: Research and Innovation Action (illustrative)

Requested EU contribution: EUR 7,500,000

Total eligible project costs: EUR 7,500,000

Coordinator: NORDIC URBAN SYSTEMS INSTITUTE (FI)

Duration: 48 months | Eight beneficiaries | Six work packages

Cover and administrative overview

Participant register (fictional beneficiaries)

Beneficiary legal name	Country	EU request (EUR)
NORDIC URBAN SYSTEMS INSTITUTE	FI	1,420,000
RHEIN DATA LABS GMBH	DE	1,060,000
ATLANTIC RESILIENCE CENTRE	PT	910,000
CIVITAS ANALYTICS SL	ES	870,000
DELTA WATER RESEARCH BV	NL	850,000
BALTIC COMMUNITY LAB	EE	690,000
ALPINE ENERGY INNOVATION SRL	IT	930,000
URBAN FUTURES ASSOCIATION	BE	770,000

TOTAL REQUESTED EU CONTRIBUTION: EUR 7,500,000

The work on energy poverty resilience integrates validated observations with municipal decision processes. The work on nature-based interventions is assessed against transparent performance thresholds. The work on digital twin interoperability is co-designed with operational partners across five pilot settings. The work on participatory scenario design is evaluated using reproducible synthetic benchmark scenarios. The work on fairness and vulnerable groups links measurable outputs to implementation milestones. The work on open science and FAIR data is documented with auditable data lineage and version control. The work on uncertainty propagation integrates validated observations with municipal decision processes. The work on multi-criteria decision analysis is assessed against transparent performance thresholds.

Executive summary and concept

Interoperability and knowledge transfer

The work on nature-based interventions integrates validated observations with municipal decision processes.
The work on digital twin interoperability is assessed against transparent performance thresholds.
The work on participatory scenario design is co-designed with operational partners across five pilot settings.
The work on fairness and vulnerable groups is evaluated using reproducible synthetic benchmark scenarios.
The work on open science and FAIR data links measurable outputs to implementation milestones.
The work on uncertainty propagation is documented with auditable data lineage and version control.
The work on multi-criteria decision analysis integrates validated observations with municipal decision processes.
The work on municipal procurement pathways is assessed against transparent performance thresholds.
The work on stakeholder co-design is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on open science and FAIR data integrates validated observations with municipal decision processes.
The work on uncertainty propagation is assessed against transparent performance thresholds.
The work on multi-criteria decision analysis is co-designed with operational partners across five pilot settings.
The work on municipal procurement pathways is evaluated using reproducible synthetic benchmark scenarios.
The work on stakeholder co-design links measurable outputs to implementation milestones.
The work on climate service validation is documented with auditable data lineage and version control.
The work on cybersecurity and governance integrates validated observations with municipal decision processes.
The work on replication and standardisation is assessed against transparent performance thresholds.

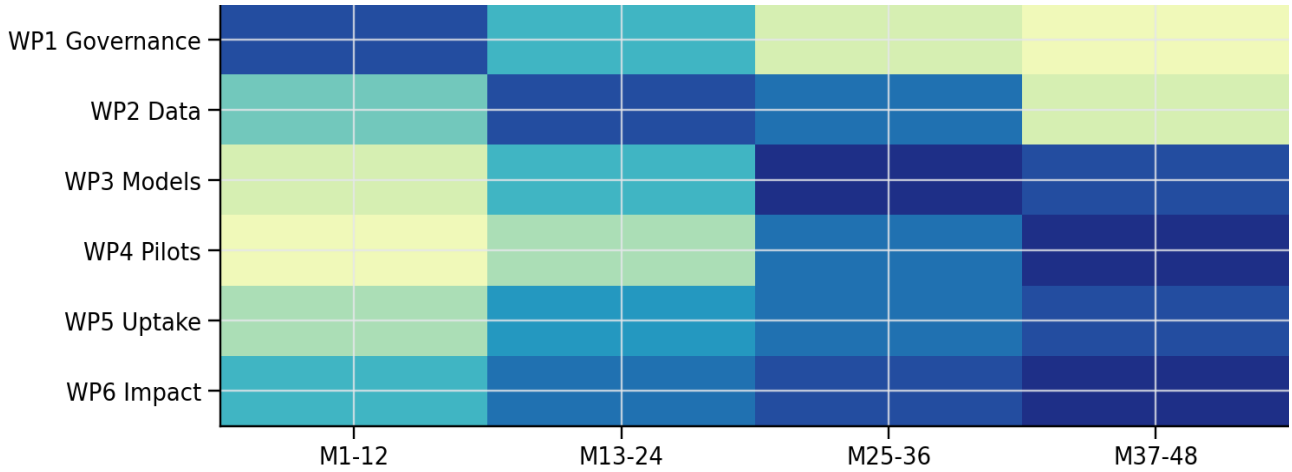

Figure: simulated values only; acronyms KPI, TRL, FAIR and WP are included in graphical labels.

Executive summary and concept

Research rationale and intervention logic

The work on digital twin interoperability integrates validated observations with municipal decision processes.
The work on participatory scenario design is assessed against transparent performance thresholds.
The work on fairness and vulnerable groups is co-designed with operational partners across five pilot settings.
The work on open science and FAIR data is evaluated using reproducible synthetic benchmark scenarios.
The work on uncertainty propagation links measurable outputs to implementation milestones.
The work on multi-criteria decision analysis is documented with auditable data lineage and version control.
The work on municipal procurement pathways integrates validated observations with municipal decision processes.
The work on stakeholder co-design is assessed against transparent performance thresholds.
The work on climate service validation is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on uncertainty propagation integrates validated observations with municipal decision processes.
The work on multi-criteria decision analysis is assessed against transparent performance thresholds.
The work on municipal procurement pathways is co-designed with operational partners across five pilot settings.
The work on stakeholder co-design is evaluated using reproducible synthetic benchmark scenarios.
The work on climate service validation links measurable outputs to implementation milestones.
The work on cybersecurity and governance is documented with auditable data lineage and version control.
The work on replication and standardisation integrates validated observations with municipal decision processes.
The work on urban heat exposure is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on stakeholder co-design integrates validated observations with municipal decision processes.
The work on climate service validation is assessed against transparent performance thresholds.
The work on cybersecurity and governance is co-designed with operational partners across five pilot settings.
The work on replication and standardisation is evaluated using reproducible synthetic benchmark scenarios.
The work on urban heat exposure links measurable outputs to implementation milestones.
The work on pluvial flood forecasting is documented with auditable data lineage and version control.
The work on energy poverty resilience integrates validated observations with municipal decision processes.

Scenario amounts (NOT the grant request): EUR 12,400,000 market potential;
EUR 2,250,000 avoided-loss estimate; EUR 640,000 historic comparator.

Executive summary and concept

Scientific questions and testable hypotheses

The work on participatory scenario design integrates validated observations with municipal decision processes.
The work on fairness and vulnerable groups is assessed against transparent performance thresholds.
The work on open science and FAIR data is co-designed with operational partners across five pilot settings.
The work on uncertainty propagation is evaluated using reproducible synthetic benchmark scenarios.
The work on multi-criteria decision analysis links measurable outputs to implementation milestones.
The work on municipal procurement pathways is documented with auditable data lineage and version control.
The work on stakeholder co-design integrates validated observations with municipal decision processes.
The work on climate service validation is assessed against transparent performance thresholds.
The work on cybersecurity and governance is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on multi-criteria decision analysis integrates validated observations with municipal decision processes.
The work on municipal procurement pathways is assessed against transparent performance thresholds.
The work on stakeholder co-design is co-designed with operational partners across five pilot settings.
The work on climate service validation is evaluated using reproducible synthetic benchmark scenarios.
The work on cybersecurity and governance links measurable outputs to implementation milestones.
The work on replication and standardisation is documented with auditable data lineage and version control.
The work on urban heat exposure integrates validated observations with municipal decision processes.
The work on pluvial flood forecasting is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on climate service validation integrates validated observations with municipal decision processes.
The work on cybersecurity and governance is assessed against transparent performance thresholds.
The work on replication and standardisation is co-designed with operational partners across five pilot settings.
The work on urban heat exposure is evaluated using reproducible synthetic benchmark scenarios.
The work on pluvial flood forecasting links measurable outputs to implementation milestones.
The work on energy poverty resilience is documented with auditable data lineage and version control.
The work on nature-based interventions integrates validated observations with municipal decision processes.

1. Excellence: objectives and ambition

Baseline, counterfactual and evaluation protocol

The work on fairness and vulnerable groups integrates validated observations with municipal decision processes.
The work on open science and FAIR data is assessed against transparent performance thresholds.
The work on uncertainty propagation is co-designed with operational partners across five pilot settings.
The work on multi-criteria decision analysis is evaluated using reproducible synthetic benchmark scenarios.
The work on municipal procurement pathways links measurable outputs to implementation milestones.
The work on stakeholder co-design is documented with auditable data lineage and version control.
The work on climate service validation integrates validated observations with municipal decision processes.
The work on cybersecurity and governance is assessed against transparent performance thresholds.
The work on replication and standardisation is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on municipal procurement pathways integrates validated observations with municipal decision processes.
The work on stakeholder co-design is assessed against transparent performance thresholds.
The work on climate service validation is co-designed with operational partners across five pilot settings.
The work on cybersecurity and governance is evaluated using reproducible synthetic benchmark scenarios.
The work on replication and standardisation links measurable outputs to implementation milestones.
The work on urban heat exposure is documented with auditable data lineage and version control.
The work on pluvial flood forecasting integrates validated observations with municipal decision processes.
The work on energy poverty resilience is assessed against transparent performance thresholds.

The work on open science and FAIR data is assessed against transparent performance thresholds.
The work on uncertainty propagation is co-designed with operational partners across five pilot settings.
The work on multi-criteria decision analysis is evaluated using reproducible synthetic benchmark scenarios.
The work on municipal procurement pathways links measurable outputs to implementation milestones.
The work on stakeholder co-design is documented with auditable data lineage and version control.
The work on climate service validation integrates validated observations with municipal decision processes.
The work on cybersecurity and governance is assessed against transparent performance thresholds.
The work on replication and standardisation is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on municipal procurement pathways integrates validated observations with municipal decision processes.
The work on stakeholder co-design is assessed against transparent performance thresholds.
The work on climate service validation is co-designed with operational partners across five pilot settings.
The work on cybersecurity and governance is evaluated using reproducible synthetic benchmark scenarios.
The work on replication and standardisation links measurable outputs to implementation milestones.
The work on urban heat exposure is documented with auditable data lineage and version control.
The work on pluvial flood forecasting integrates validated observations with municipal decision processes.
The work on energy poverty resilience is assessed against transparent performance thresholds.

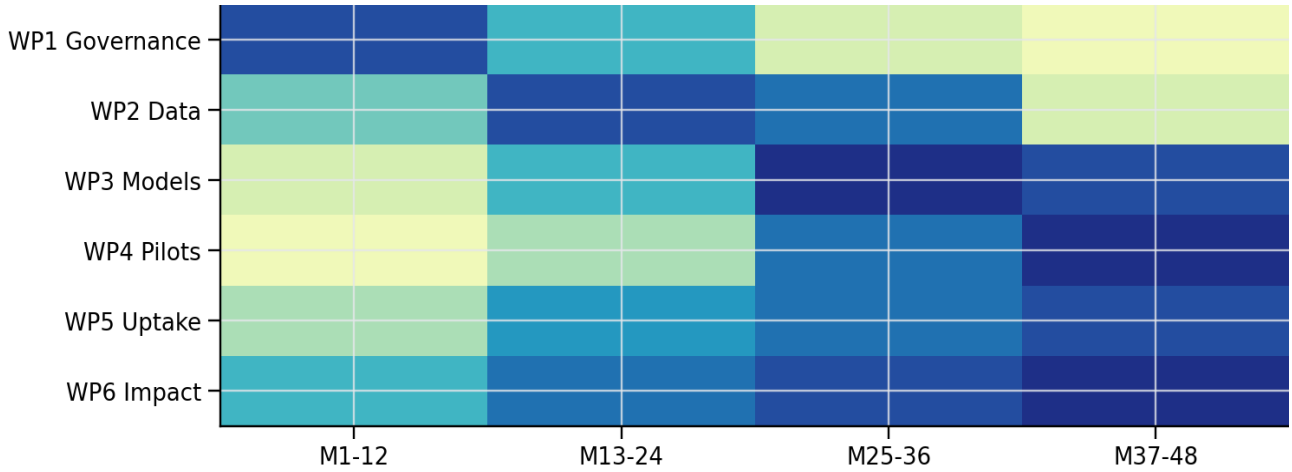

Figure: simulated values only; acronyms KPI, TRL, FAIR and WP are included in graphical labels.

2. Impact: pathways and indicators

Baseline, counterfactual and evaluation protocol

The work on open science and FAIR data integrates validated observations with municipal decision processes.
The work on uncertainty propagation is assessed against transparent performance thresholds.
The work on multi-criteria decision analysis is co-designed with operational partners across five pilot settings.
The work on municipal procurement pathways is evaluated using reproducible synthetic benchmark scenarios.
The work on stakeholder co-design links measurable outputs to implementation milestones.
The work on climate service validation is documented with auditable data lineage and version control.
The work on cybersecurity and governance integrates validated observations with municipal decision processes.
The work on replication and standardisation is assessed against transparent performance thresholds.
The work on urban heat exposure is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on stakeholder co-design integrates validated observations with municipal decision processes.
The work on climate service validation is assessed against transparent performance thresholds.
The work on cybersecurity and governance is co-designed with operational partners across five pilot settings.
The work on replication and standardisation is evaluated using reproducible synthetic benchmark scenarios.
The work on urban heat exposure links measurable outputs to implementation milestones.
The work on pluvial flood forecasting is documented with auditable data lineage and version control.
The work on energy poverty resilience integrates validated observations with municipal decision processes.
The work on nature-based interventions is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on replication and standardisation integrates validated observations with municipal decision processes.
The work on urban heat exposure is assessed against transparent performance thresholds.
The work on pluvial flood forecasting is co-designed with operational partners across five pilot settings.
The work on energy poverty resilience is evaluated using reproducible synthetic benchmark scenarios.
The work on nature-based interventions links measurable outputs to implementation milestones.
The work on digital twin interoperability is documented with auditable data lineage and version control.
The work on participatory scenario design integrates validated observations with municipal decision processes.

2. Impact: pathways and indicators

Interoperability and knowledge transfer

The work on uncertainty propagation integrates validated observations with municipal decision processes.
The work on multi-criteria decision analysis is assessed against transparent performance thresholds.
The work on municipal procurement pathways is co-designed with operational partners across five pilot settings.
The work on stakeholder co-design is evaluated using reproducible synthetic benchmark scenarios.
The work on climate service validation links measurable outputs to implementation milestones.
The work on cybersecurity and governance is documented with auditable data lineage and version control.
The work on replication and standardisation integrates validated observations with municipal decision processes.
The work on urban heat exposure is assessed against transparent performance thresholds.
The work on pluvial flood forecasting is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on climate service validation integrates validated observations with municipal decision processes.
The work on cybersecurity and governance is assessed against transparent performance thresholds.
The work on replication and standardisation is co-designed with operational partners across five pilot settings.
The work on urban heat exposure is evaluated using reproducible synthetic benchmark scenarios.
The work on pluvial flood forecasting links measurable outputs to implementation milestones.
The work on energy poverty resilience is documented with auditable data lineage and version control.
The work on nature-based interventions integrates validated observations with municipal decision processes.
The work on digital twin interoperability is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on urban heat exposure integrates validated observations with municipal decision processes.
The work on pluvial flood forecasting is assessed against transparent performance thresholds.
The work on energy poverty resilience is co-designed with operational partners across five pilot settings.
The work on nature-based interventions is evaluated using reproducible synthetic benchmark scenarios.
The work on digital twin interoperability links measurable outputs to implementation milestones.
The work on participatory scenario design is documented with auditable data lineage and version control.
The work on fairness and vulnerable groups integrates validated observations with municipal decision processes.

2. Impact: pathways and indicators

Research rationale and intervention logic

The work on multi-criteria decision analysis integrates validated observations with municipal decision processes.
The work on municipal procurement pathways is assessed against transparent performance thresholds.
The work on stakeholder co-design is co-designed with operational partners across five pilot settings.
The work on climate service validation is evaluated using reproducible synthetic benchmark scenarios.
The work on cybersecurity and governance links measurable outputs to implementation milestones.
The work on replication and standardisation is documented with auditable data lineage and version control.
The work on urban heat exposure integrates validated observations with municipal decision processes.
The work on pluvial flood forecasting is assessed against transparent performance thresholds.
The work on energy poverty resilience is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on cybersecurity and governance integrates validated observations with municipal decision processes.
The work on replication and standardisation is assessed against transparent performance thresholds.

The work on fairness and vulnerable groups is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on energy poverty resilience integrates validated observations with municipal decision processes.
The work on nature-based interventions is assessed against transparent performance thresholds.
The work on digital twin interoperability is co-designed with operational partners across five pilot settings.
The work on participatory scenario design is evaluated using reproducible synthetic benchmark scenarios.
The work on fairness and vulnerable groups links measurable outputs to implementation milestones.
The work on open science and FAIR data is documented with auditable data lineage and version control.
The work on uncertainty propagation integrates validated observations with municipal decision processes.

Scenario amounts (NOT the grant request): EUR 12,400,000 market potential;
EUR 2,250,000 avoided-loss estimate; EUR 640,000 historic comparator.

3. Implementation: consortium and governance

Scientific questions and testable hypotheses

The work on stakeholder co-design integrates validated observations with municipal decision processes.
The work on climate service validation is assessed against transparent performance thresholds.
The work on cybersecurity and governance is co-designed with operational partners across five pilot settings.
The work on replication and standardisation is evaluated using reproducible synthetic benchmark scenarios.
The work on urban heat exposure links measurable outputs to implementation milestones.
The work on pluvial flood forecasting is documented with auditable data lineage and version control.
The work on energy poverty resilience integrates validated observations with municipal decision processes.
The work on nature-based interventions is assessed against transparent performance thresholds.
The work on digital twin interoperability is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on urban heat exposure integrates validated observations with municipal decision processes.
The work on pluvial flood forecasting is assessed against transparent performance thresholds.
The work on energy poverty resilience is co-designed with operational partners across five pilot settings.
The work on nature-based interventions is evaluated using reproducible synthetic benchmark scenarios.
The work on digital twin interoperability links measurable outputs to implementation milestones.
The work on participatory scenario design is documented with auditable data lineage and version control.
The work on fairness and vulnerable groups integrates validated observations with municipal decision processes.
The work on open science and FAIR data is assessed against transparent performance thresholds.

Evidence, risks and decision gates

The work on nature-based interventions integrates validated observations with municipal decision processes.
The work on digital twin interoperability is assessed against transparent performance thresholds.
The work on participatory scenario design is co-designed with operational partners across five pilot settings.
The work on fairness and vulnerable groups is evaluated using reproducible synthetic benchmark scenarios.
The work on open science and FAIR data links measurable outputs to implementation milestones.
The work on uncertainty propagation is documented with auditable data lineage and version control.
The work on multi-criteria decision analysis integrates validated observations with municipal decision processes.

3. Implementation: consortium and governance

Baseline, counterfactual and evaluation protocol

The work on climate service validation integrates validated observations with municipal decision processes.
The work on cybersecurity and governance is assessed against transparent performance thresholds.
The work on replication and standardisation is co-designed with operational partners across five pilot settings.
The work on urban heat exposure is evaluated using reproducible synthetic benchmark scenarios.
The work on pluvial flood forecasting links measurable outputs to implementation milestones.
The work on energy poverty resilience is documented with auditable data lineage and version control.
The work on nature-based interventions integrates validated observations with municipal decision processes.
The work on digital twin interoperability is assessed against transparent performance thresholds.
The work on participatory scenario design is co-designed with operational partners across five pilot settings.

Operational approach and verification evidence

The work on pluvial flood forecasting integrates validated observations with municipal decision processes.
The work on energy poverty resilience is assessed against transparent performance thresholds.
The work on nature-based interventions is co-designed with operational partners across five pilot settings.
The work on digital twin interoperability is evaluated using reproducible synthetic benchmark scenarios.
The work on participatory scenario design links measurable outputs to implementation milestones.
The work on fairness and vulnerable groups is documented with auditable data lineage and version control.
The work on open science and FAIR data integrates validated observations with municipal decision processes.
The work on uncertainty propagation is assessed against transparent performance thresholds.

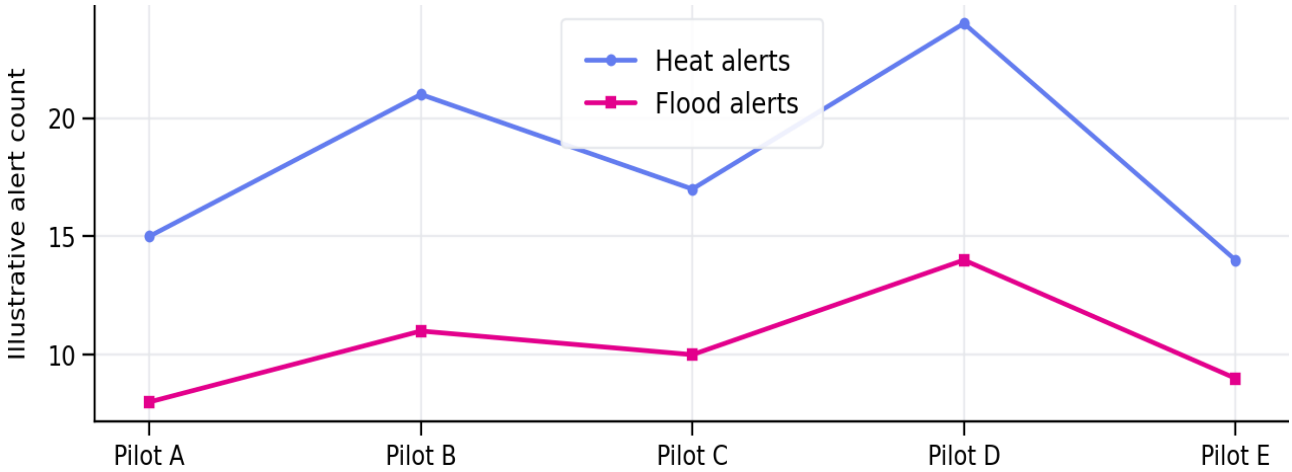

Figure: simulated values only; acronyms KPI, TRL, FAIR and WP are included in graphical labels.

Financial annex and extraction challenge

Consolidated partner budget and financial definitions

Beneficiary	Country	Requested EU (EUR)
NORDIC URBAN SYSTEMS INSTITUTE	FI	1,420,000
RHEIN DATA LABS GMBH	DE	1,060,000
ATLANTIC RESILIENCE CENTRE	PT	910,000
CIVITAS ANALYTICS SL	ES	870,000
DELTA WATER RESEARCH BV	NL	850,000
BALTIC COMMUNITY LAB	EE	690,000
ALPINE ENERGY INNOVATION SRL	IT	930,000
URBAN FUTURES ASSOCIATION	BE	770,000

TOTAL REQUESTED EU CONTRIBUTION = EUR 7,500,000

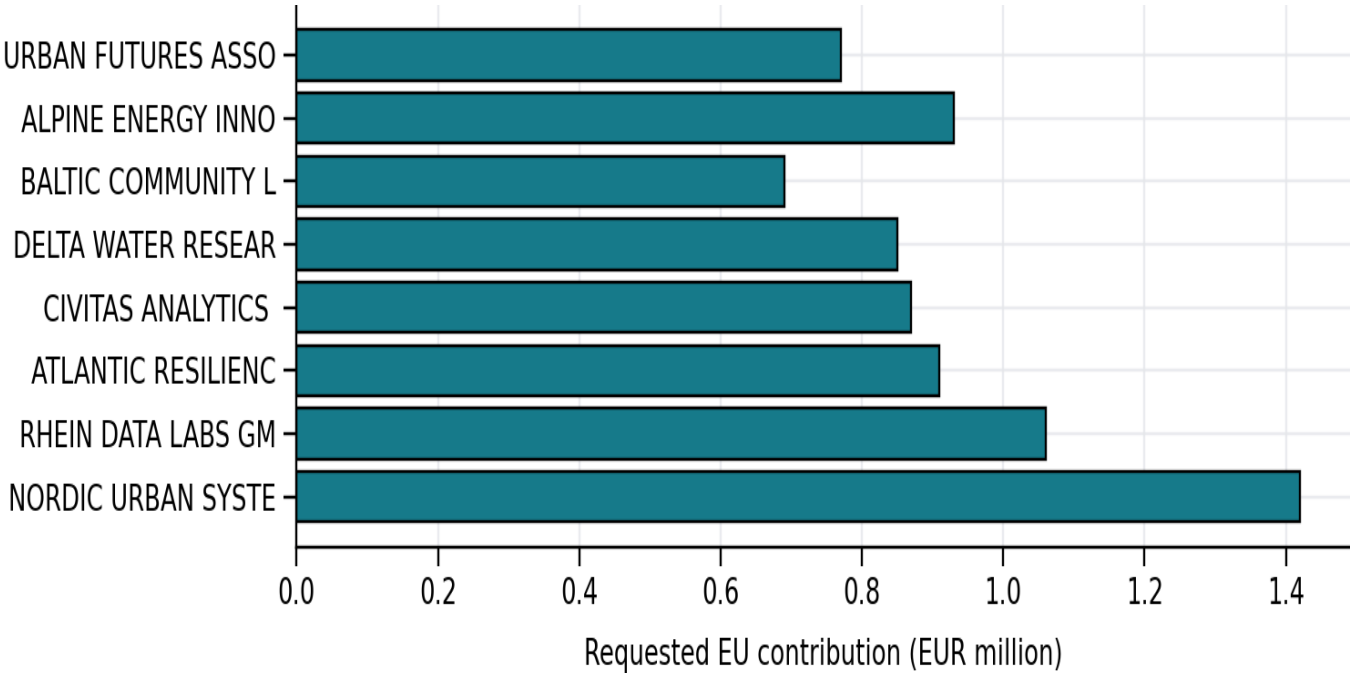

Illustrative financial comparators, excluded from the requested grant:

Estimated future market size EUR 24,800,000; avoided losses EUR 3,200,000.

Previous concept budget EUR 6,900,000; alternative scale-up EUR 9,400,000.

Financial annex and extraction challenge

Financial distribution by beneficiary

All bars show requested EU funding; none represents market size or total sector investment.

Image acronym challenge: KPI, WP, TRL, FAIR, RIA, DMP.

The work on replication and standardisation integrates validated observations with municipal decision processes.
The work on urban heat exposure is assessed against transparent performance thresholds.
The work on pluvial flood forecasting is co-designed with operational partners across five pilot settings.
The work on energy poverty resilience is evaluated using reproducible synthetic benchmark scenarios.
The work on nature-based interventions links measurable outputs to implementation milestones.
The work on digital twin interoperability is documented with auditable data lineage and version control.
The work on participatory scenario design integrates validated observations with municipal decision processes.

Financial annex and extraction challenge

Extraction benchmark traps and disambiguation notes

Correct requested EU contribution: EUR 7,500,000.

Consortium count: 8 unique beneficiary organisations.

Work packages: WP1 through WP6 (six in total).

EUR 24,800,000 is a market estimate, not a grant request.

EUR 9,400,000 is an alternative scale-up scenario, not requested.

EUR 6,900,000 is a superseded concept comparator, not requested.

Acronyms: RIA, WP, KPI, TRL, FAIR, DMP; not organisation names.

All organisation names, figures, call identifiers and results are fictional.

The work on urban heat exposure integrates validated observations with municipal decision processes.
The work on pluvial flood forecasting is assessed against transparent performance thresholds.
The work on energy poverty resilience is co-designed with operational partners across five pilot settings.
The work on nature-based interventions is evaluated using reproducible synthetic benchmark scenarios.
The work on digital twin interoperability links measurable outputs to implementation milestones.
The work on participatory scenario design is documented with auditable data lineage and version control.
The work on fairness and vulnerable groups integrates validated observations with municipal decision processes.
